Question

Consider the drug interaction problem of d drugs to find out adverse combinations of drugs. To optimize the communication cost, assume that the set of drugs is categorized into g groups. Identify all the correct statements for the All-Pairs drug interaction using Map-Reduce.

4. Options

1 point

Check all that apply.

- ☐ The lower bound replication rate for a reducer of size q is d/q .
- ☐ If the total number of drugs d are 1000 and the number of groups are 100, the total number of reducers are 4950.
- ☐ If the total number of drugs are 451 and each reducer size q is 10, the total input size to all the reducers for the lower bound scenario is 22550.
- ☐ If the total number of drugs are 900 and each reducer size q is 10, the total number of reducers is 8990.
