ICE 13.1

Aman Gupta • Apr 27, 2025 (Edited Apr 27, 2025)

8 points

1. (2 marks) From the viewpoint of securing a wireless network, the problem is particularly challenging since:

- A wireless network can be accessed by any nearby device
- There exists no way to authenticate a client or a server
- **A rogue client or a rouge AP may be installed unless there exists mechanism to authenticate the client or the AP (correct)**
- None of the above
- All of the above

2. (3 marks) A client C wishes to connect to a wireless LAN which hosts a AAA server. Client C does not send a password, nor does the AAA server expect to receive a password from the client C. Then how can AAA server authenticate the client C? That is, what information should AAA server possess that will enable it to authenticate client C?

- **AAA server possesses the Public-key certificate of AAA issued by a CA, and the public-key of CA (correct)**
- AAA server possesses the Public-key certificate of client C, alone
- AAA server possesses the Public-key of CA, alone
- None of the above

3. (3 marks) Continuing with question 2, what kind of message should client C send to AAA server so that client C can be authenticated?

- **Client C sends a message to AAA server with its ID suitably encrypted with Private key of client C (correct)**
- Client C sends a message to AAA server with its ID suitably encrypted with Public key of client C
- Client C sends a message to AAA server with its ID suitably encrypted with Private key of server AAA
- Client C sends a message to AAA server with its ID suitably encrypted with Public key of server AAA
